

REQUI Trading Intelligence — Prompt Testing & Performance Review

Objective: Evaluate the Intelligence Module’s ability to perform comprehensive investment research across market activity, fundamental analysis, earnings intelligence, technical analysis, and portfolio risk.

The following five prompts were tested to identify performance gaps, incomplete data retrieval, and areas requiring improvement.

Prompt 1: Market Intelligence & Unusual Trading Activity

Test Prompt:

“Analyze the current U.S. stock market and identify five stocks showing unusual trading volume, strong price momentum, or significant institutional activity. Explain what’s driving the activity, evaluate the supporting data, and identify potential risks. Rank the stocks by the strength of their supporting research evidence.”

Test Result: FAILED

Observations:

- The Intelligence Module defaulted to quarterly earnings analysis, despite the prompt not requesting earnings-related research.
- The module demonstrated poor performance after regular market hours.
- It failed to adequately address unusual trading volume, price momentum, and institutional activity.

Required Improvements:

The Intelligence Module must accurately interpret the user's research objectives without automatically defaulting to quarterly earnings analysis.

It must also support after-hours research by utilizing the latest available market data, including extended-hours activity when accessible, and clearly distinguish current trading activity from historical data.

Prompt 2: Fundamental Analysis & Valuation

Test Prompt:

“Compare NVIDIA (NVDA), AMD, and Broadcom (AVGO) using their latest available financial reports. Evaluate revenue growth, profitability, free cash flow, valuation multiples, and competitive positioning. Which company has the strongest financial fundamentals, and how do their current valuations compare with their historical averages?”

Test Result: FAILED — Incomplete Data

Observations:

- The module returned incomplete financial data.
- It defaulted to quarterly earnings commentary rather than conducting the requested fundamental analysis.
- The response did not adequately address all requested financial metrics and valuation comparisons.

Required Improvements:

The Intelligence Module must retrieve and analyze the latest available financial statements, historical financial performance, valuation multiples, and relevant competitive data.

It should distinguish between earnings-event analysis and fundamental financial research.

Responses must directly address every requested financial metric and provide meaningful comparisons supported by available data.

Prompt 3: Earnings Intelligence & Predictive Research

Test Prompt:

“Identify three publicly traded companies reporting earnings within the next seven days. Analyze historical earnings surprises, analyst estimate revisions, options-implied volatility, and previous post-earnings price reactions. Estimate the probability of each company exceeding earnings expectations and explain the key factors that could influence its stock price following the announcement.”

Test Result: FAILED — Incomplete Data

Observations:

The Intelligence Module failed to provide the complete dataset required to conduct the requested earnings research and predictive analysis.

Required Improvements:

The module must retrieve and evaluate all relevant earnings intelligence, including upcoming earnings dates, historical earnings surprises, analyst estimate revisions,

options-implied volatility, and historical post-earnings price reactions.

Probability estimates must be supported by available historical data and a clearly defined analytical methodology.

When certain datasets are unavailable, the module should identify the missing information, explain its impact on the analysis, and complete the remaining research rather than abandoning the entire request.

Prompt 4: Technical Analysis & Market Structure

Test Prompt:

“Analyze Tesla (TSLA) using its latest available market data. Evaluate its 20-day, 50-day, and 200-day moving averages, RSI, MACD, trading volume, and major support and resistance levels. Determine whether the technical evidence suggests bullish, bearish, or neutral market conditions. Identify the price levels that would confirm or invalidate each scenario.”

Test Result: PASSED

Observations:

The Intelligence Module successfully completed the requested technical analysis.

Required Improvements:

No specific issues were identified during this test. Continue monitoring technical indicator accuracy, data freshness, and consistency across different securities and market conditions.

Prompt 5: Portfolio Risk & Macroeconomic Research

Test Prompt:

“Analyze how a hypothetical \$100,000 portfolio consisting of 40% technology stocks, 30% financial stocks, 20% healthcare stocks, and 10% cash could perform under three economic scenarios: declining interest rates, persistent inflation, and an economic recession. Evaluate sector correlations, historical drawdowns, concentration risk, and potential portfolio vulnerabilities. Explain which economic indicators would be most important to monitor.”

Test Result: FAILED

Observations:

The Intelligence Module failed to complete the requested portfolio risk and macroeconomic analysis.

The specific cause of the failure has not yet been identified.

Required Improvements:

The module must support hypothetical portfolio analysis without requiring users to connect a brokerage account or provide an existing portfolio.

It should be capable of conducting scenario-based research using historical market data, sector correlations, macroeconomic indicators, and relevant risk metrics.

The module must also distinguish between hypothetical research and analysis of an actual user portfolio.

Overall Testing Summary

Test	Research Category	Result
1	Market Intelligence & Unusual Trading	FAILED
2	Fundamental Analysis & Valuation	FAILED
3	Earnings Intelligence & Predictive	FAILED
4	Technical Analysis & Market Structure	PASSED
5	Portfolio Risk & Macroeconomic	FAILED

Overall Result: 1 of 5 tests passed (20%).

Key Issues Requiring Investigation

The testing results indicate four primary areas requiring further investigation:

- 1. Prompt interpretation:** The module repeatedly defaults to quarterly earnings analysis, even when the user's request concerns unrelated research topics.
- 2. Data retrieval and completeness:** The module does not consistently retrieve or present the information required to complete fundamental, earnings, and market intelligence research.
- 3. After-hours functionality:** Market intelligence performance deteriorates after regular trading hours. The module should continue providing meaningful research using the latest available data, with appropriate timestamps and disclosures.
- 4. Research flexibility:** The module must support hypothetical portfolios, macroeconomic research, and general investment analysis without requiring a connected brokerage account or an existing user portfolio.
